

Extra tracing

Description

The Emergency Safety Shower it self is protected against frost and suitable for outdoor use. The water supply pipe from the supply to the Safety Shower needs to be protected against frost (cold temperatures). This is something you can organize your self, but we can offer you also a suitable solution.

We can supply you with an extra piece (length of your choice) of tracing which is available at the water supply of the Safety Shower and can be positioned along the water supply pipe. Afterwards you only need to insulate this pipe piece. When you like to have also a solution for this as well, than we have a ready to use solution for you. This is our MB 700 module which you can see next to this option. This is a frost protected piece which is insulated and electrical trace tape heated including a quick and simple connection piece in order to connect onto the Safety Shower.

The tracing is already electrically connected for you into the junction box and doesn't give you any extra work, the ending of the tracing has been treated appropriate as well of course.

This option is recommended by us for our trace tape heated models like; MB 250 / MB 200 / MB 60 / MB 65 / MB50 OD / etc. to be added, but is also possible with other models from us, like for example our Tank Showers series or to be supplied as separate pieces with a length of your choice.

The power of the tracing is 10 Watt per meter and can be standard connected to 230 V (other specifications are possible). A thermostat can be supplied as well when you like. This option is also available in a Flame Proof / ATEX solution.
