

Manure cellar suit

Description

At a response action in a manure cellar where manure (or other aggressive chemicals) are involved, the life span of the Breathing Apparatus is much shortened (manure is aggressive to the breathing apparatus set). This Breathing Apparatus set is a valuable piece of Personal Protection Equipment and needs to be protected as much as possible. The Breathing Apparatus Set needs to be disconnected, cleaned, re-assembled and tested after a response action when the Breathing Apparatus Set is contaminated. Sometimes even parts need to be replaced. We do not have to explain that this is time consuming and cost worthy. Do you spent a lot of time by cleaning your Breathing Apparatus Set after an operation? Than the Manure Cellar Suit is the solution for you!

Breathing Apparatus (cylinders) are located inside the suit and can therefore not be contaminated!

Also the clothing which is worn underneath the Suit is of course also protected by the suit.

Specifications

- hood part is big enough in order to go over a Gallet helmet
- large entry for easy entrance
- interchangeable gloves due to cuff system. Fluid tight!
- breathing Apparatus cylinders can easily be exchanged without complete donning of the suit.
- permanent sealed Safety boots S5 quality and obtainable in different sizes
- a lot of moving space inside the suit
- easy cleaning by rinsing with water
