

Description

The first of its kind, Cygnus DIVE is the latest innovation from Cygnus Instruments, pioneers of the multiple echo thickness gauge. The wrist-mounted ultrasonic underwater thickness gauge was designed for the professional diver. It delivers accurate meter readings, is reliable and simple to use. Worn on the diver's forearm it gives an invaluable free hand whilst performing thickness surveys underwater.

Made from a tough glass-filled resin, Cygnus DIVE can withstand the knocks and bumps of the diving environment. An oversized bright colour TFT screen displays the thickness measurement in large numbers that really stand out – select the display colour of your choice.

As with all Cygnus products, Cygnus DIVE has been designed for easy operation. There are no gates to set up, and no gain to adjust – simply turn on and begin your underwater thickness measurement. With just two buttons to operate, benefit from quick and easy menu navigation using one hand and from here access all the functions of the gauge guided by intuitive, clear menus.
